## PLEASE NOTE

Please read these instructions carefully and examine the equipment in order to familiarize yourself with the device before installing, operating or carrying out any maintenance work on it.

The following special messages that you will come across in this document or on the device are designed to warn you about potential risks or draw your attention to information that will clarify or simplify a procedure.

The addition of this symbol to a "Danger" or "Warning" safety label indicates that there is an electrical risk that will result in injury if the instructions are not followed.

This is a safety warning symbol. It warns you of the potential risk of injury. You must comply with all safety messages that follow this symbol in order to avoid the risk of injury or death.

## 4 DANGER

DANGER indicates an imminently hazardous situation which, if not avoided, will result in death, serious injury or equipment damage.

## A WARNING

WARNING indicates a potentially hazardous situation which, if not avoided, can result in death, serious injury or equipment damage.

## A CAUTION

CAUTION indicates a potentially hazardous situation which, if not avoided, can result in injury or equipment damage.

## PLEASE NOTE:

Only qualified personnel are authorized to carry out maintenance work on electrical equipment. Schneider Electric accepts no responsibility for the consequences of using this device. This document does not constitute an instruction manual for inexperienced personnel. © 2006 Schneider Electric. All rights reserved.

Read and understand these instructions before performing any procedure using this drive.

## DANGER

## RISK OF ELECTRIC SHOCK

- Read and understand this manual before installing or operating the Altivar 71 drive. Installation, adjustment, repair, and maintenance must be performed by qualified personnel.
- The user is responsible for compliance with all international and national electrical standards in force concerning protective grounding of all equipment.
- Many parts in this variable speed drive, including printed wiring boards, operate at line voltage. DO NOT TOUCH. Use only electrically insulated tools.
- DO NOT touch unshielded components or terminal strip screw connections with voltage present.
- DO NOT short across terminals PA and PB or across the DC bus capacitors.
- Install and close all the covers before applying power or starting and stopping the drive.
- Before servicing the variable speed drive:
- Disconnect all power.
- Place a "DO NOT TURN ON" label on the variable speed drive disconnect.
- Lock the disconnect in the open position.
- Disconnect all power including external control power that may be present before servicing the drive. WAIT 15 MINUTES to allow the DC bus capacitors to discharge. Then follow the DC bus voltage measurement procedure on page 19 to verify that the DC voltage is less than 45 V . The drive LEDs are not accurate indicators of the absence of DC bus voltage.
Failure to follow these instructions will result in death or serious injury.

## A CAUTION

IMPROPER DRIVE OPERATION

- If the drive is not turned on for a long period, the performance of its electrolytic capacitors will be reduced.
- If it is stopped for a prolonged period, turn the drive on every two years for at least 5 hours to restore the performance of the capacitors, then check its operation. It is recommended that the drive is not connected directly to the line voltage. The voltage should be increased gradually using an adjustable AC source.
Failure to follow these instructions can result in injury and/or equipment damage.

Steps for setting up the drive

## INSTALLATION

$\square 1$ Receive and inspect the drive controller

- Check that the catalog number printed on the label is the same as that on the purchase order
$\square$ Remove the Altivar from its packaging and check that it has not been damaged in transit
$\square 2$ Check the line voltage
- Check that the line voltage is compatible with the voltage range of the drive (see pages $\underline{9}, \underline{10}$ and 11 )
Steps 1 to 4 must be performed with the power off.

3 Mount the drive

- Mount the drive in accordance with the instructions in this document
Install any internal and external options

4 Wire the drive

- Connect the motor, ensuring that its connections correspond to the voltage

- Connect the line supply, after making sure that the power is off
- Connect the control
- Connect the speed reference

## PROGRAMMING

$\square 5$ Please refer to the
Programming Manual

## Preliminary recommendations

## Handling and storage

To protect the drive prior to installation, handle and store the device in its packaging. Ensure that the ambient conditions are acceptable.

## A WARNING

## DAMAGED PACKAGING

If the packaging appears damaged, it can be dangerous to open it or handle it.
Take precautions against all risks when performing this operation.
Failure to follow these instructions can result in death, serious injury or equipment damage.

## 4 WARNING

DAMAGED EQUIPMENT
Do not install or operate any drive that appears damaged.
Failure to follow this instruction can result in death, serious injury or equipment damage.

## Handling on installation

ALTIVAR 71 drives up to ratings ATV71HD15M3X, ATV71HD18N4 and ATV71HU75S6X can be removed from their packaging and installed without a handling device.

A hoist must be used for higher ratings and for ATV71HeeoY drives; for this reason, these drives all have lifting lugs. Follow the recommendations on the next page.

## Preliminary recommendations

## Precautions

Read and understand the instructions in the Programming Manual.

## A CAUTION

## INCOMPATIBLE LINE VOLTAGE

Before turning on and configuring the drive, ensure that the line voltage is compatible with the supply voltage range shown on the drive nameplate. The drive may be damaged if the line voltage is not compatible.
Failure to follow this instruction can result in injury and/or equipment damage.

## DANGER

## UNINTENDED EQUIPMENT OPERATION

- Before turning on and configuring the Altivar 71, check that the PWR (POWER REMOVAL) input is deactivated (at state 0) in order to prevent unintended operation.
- Before turning on the drive, or when exiting the configuration menus, check that the inputs assigned to the run command are deactivated (at state 0 ) since they can cause the motor to start immediately.
Failure to follow these instructions will result in death or serious injury.

If the safety of personnel requires the prohibition of unwanted or unintended operation, electronic locking is performed by the Altivar 71 's Power Removal function.
This function requires the use of connection diagrams conforming to category 3 of standard EN 954-1, ISO 13849-1 and safety integrity level 2 according to IEC/EN 61508.
The Power Removal function takes priority over any run command.

## Single-phase supply voltage: 200... 240 V $50 / 60 \mathrm{~Hz}$

Three-phase motor 200... 240 V

(1) These power ratings and currents are given for an ambient temperature of $50^{\circ} \mathrm{C}\left(122^{\circ} \mathrm{F}\right)$ at the factory-set switching frequency, used in continuous operation (factory-set switching frequency of 4 kHz for ATV71H 037M3 to D15M3X and 2.5 kHz for ATV71H D18M3X to D45M3X).
Above this factory setting, the drive will reduce the switching frequency automatically in the event of excessive temperature rise. For continuous operation above the factory setting, derating must be applied to the nominal drive current in accordance with the curves on page 14.
(2) Current on a line supply with the "Max. prospective line Isc" indicated and for a drive without any external options.
(3)Peak current on power-up for the max. voltage ( $240 \mathrm{~V}+10 \%$ ).
(4)ATV71H 037M3 to D45M3X drives are available with or without a graphic display terminal. Catalog numbers for drives without a graphic display terminal have the letter Z added at the end, e.g.: ATV71H075M3Z. This option is not available for drives operating in difficult environmental conditions (5).
(5) Drives with the S 337 or 337 extension are designed for use in difficult environmental conditions (class 3C2 in accordance with IEC 721-3-3). They are supplied with a graphic display terminal.
(6)A line choke must be used (please refer to the catalog).
(7) Drives with the extension 383 are intended for use with synchronous motors.

Inhibit the input phase loss fault (IPL) so that ATV71H 075M3 to U75M3 drives can operate on a single-phase supply (see Programming Manual). If this fault is set to its factory configuration, the drive will stay locked in fault mode.

Three-phase supply voltage: $\mathbf{3 8 0} . . .480 \mathrm{~V} 50 / 60 \mathrm{~Hz}$
Three-phase motor 380... 480 V

| 55 | 75 | 75 | 84 | 70.5 | 88 | 22 | 85 | 77 | 84 | ATV71HD75Y |
| 75 | 100 | 90 | 109 | 92 | 101 | 22 | 110 | 99 | 104 | ATV71HD90Y |

(1) These power ratings and currents are given for an ambient temperature of $50^{\circ} \mathrm{C}\left(122^{\circ} \mathrm{F}\right)$ at the factory-set switching frequency, used in continuous operation (factory-set switching frequency of 4 kHz for ATV71eeeS6X, ATV71H U22Y to D30Y and 2.5 kHz for ATV71H D37Y to D90Y).
Above this factory setting, the drive will reduce the switching frequency automatically in the event of excessive temperature rise. For continuous operation above the factory setting, derating must be applied to the nominal drive current in accordance with the curves on page 14.
(2) Current on a line supply with the "Max. prospective line Isc" indicated and for a drive without any external options.

## Note:

The maximum transient current for 60 s corresponds to $150 \%$ of the maximum nominal current In.
The maximum transient current for 2 s corresponds to $165 \%$ of the maximum nominal current In.

## Dimensions and weights

With graphic display terminal

## Without graphic display terminal

For a drive without a graphic display terminal, dimensions c, c1 and c2 in the table above are reduced by 26 mm (1.01 in.). The other dimensions are unchanged.
(1)For the addition of I/O extension cards, communication cards, or the "Controller Inside" programmable card.

Install the drive vertically at $\pm 10^{\circ}$.
Do not place it close to heating elements.
Leave sufficient free space to ensure that the air required for cooling purposes can circulate from the bottom to the top of the unit.

Free space in front of the drive: 10 mm ( 0.39 in .) minimum
When IP20 protection is adequate, it is recommended that the protective cover on the top of the drive is removed as shown below.

## Removing the protective cover

ATV71H 037M3 to D15M3X, ATV71H 075N4 to D18N4 and ATV71H U15S6X to U75S6X

ATV71H D18M3X to D45M3X, ATV71H D22N4 to D75N4 and ATV71H U22Y to D90Y

Two types of mounting are possible:

Type A mounting

Free space $\geqslant 50 \mathrm{~mm}(\geqslant 1.97 \mathrm{in}$. ) on each side, with protective cover fitted

Type B Drives mounted side by side, with the protective cover removed (the degree of protection becomes IP20) mounting

Type C Free space $\geqslant 50 \mathrm{~mm}(\geqslant 1.97 \mathrm{in}$.) on each side, with protective cover removed (the degree of protection becomes IP20) mounting

## Mounting and temperature conditions

## Derating curves

Derating curves for the drive current In as a function of the temperature, switching frequency and type of mounting.
ATV71H 037M3 to D15M3X and ATV71H 075N4 to D18N4

ATV71H D22N4 and ATV71H D30N4 (1)

ATV71H D18M3X to D45M3X and ATV71H D37N4 to D75N4 (1)

For intermediate temperatures (e.g. $55^{\circ} \mathrm{C}\left(131^{\circ} \mathrm{F}\right)$ ), interpolate between two curves.
Above $50^{\circ} \mathrm{C}\left(122^{\circ} \mathrm{F}\right)$, these drives must be equipped with a control card fan kit. Please refer to the catalog.

## Mounting and temperature conditions

## Derating for ATV71HeeoS6X

## Mounting type $A$ and $B$ :

ATV71H•eッS6X drives can operate with a switching frequency $2,5 \ldots 6 \mathrm{kHz}$ up to $50^{\circ} \mathrm{C}$ without derating.

## Mounting type C:

ATV71HeeeS6X drives can operate with a switching frequency $2,5 \ldots 6 \mathrm{kHz}$ up to $60^{\circ} \mathrm{C}$ without derating. For operation above $50^{\circ} \mathrm{C}\left(122^{\circ} \mathrm{F}\right)$, power supply voltage must be limited up to $600 \mathrm{~V}+5 \%$.

## ATV71H U22Y to D30Y

## ATV71H D37Y to D90Y

For intermediate temperatures (e.g. $55^{\circ} \mathrm{C}\left(131^{\circ} \mathrm{F}\right)$ ), interpolate between two curves.

## Mounting in a wall-mounted or floor-standing enclosure

Follow the mounting recommendations on the previous pages. To ensure proper air circulation in the drive:

- Fit ventilation grilles.
- Ensure that the ventilation is adequate: if not, install a forced ventilation unit with a filter.
- Use special IP54 filters.

## Dust and damp proof metal wall-mounted or floorstanding enclosure (IP 54 degree of protection)

The drive must be mounted in a dust and damp proof enclosure in certain environmental conditions: dust, corrosive gases, high humidity with risk of condensation and dripping water, splashing liquid, etc.

To avoid hot spots in the drive, add a fan to circulate the air inside the enclosure, catalog number VW3 A9 4ee (see catalog).

## Mounting the drive in the enclosure

## Dissipated power

These levels of power dissipation are given for operation at nominal load and for the factory-set switching frequency.

| ATV71H | Dissipated power (1) | ATV71H | Dissipated power (1) |
| :---: | :---: | :---: | :---: |
|  | W |  | W |
| 037M3 | 46 | 075N4 | 44 |

|  | $\mathrm{m}^{3} / \mathrm{hour}$ | $\mathrm{ft}^{3} / \mathrm{min}$ |
| U22Y to D30Y | 330 | 194 |
| D37Y to D90Y | 406 | 234 |

## Dust and damp proof flange mounting

This mounting is used to reduce the power dissipated in the enclosure by locating the power section outside the enclosure.
This requires the use of a dust and damp proof flange-mounting kit VW3 A9 501... 509 (please refer to the catalog).
The degree of protection for the drives mounted in this way becomes IP54.
To install the kit on the drive, please refer to the manual supplied with the kit.

Example: ATV71HU55N4

Power dissipated inside the enclosure for dust and damp proof flange mounting
These levels of power dissipation are given for operation at nominal load and for the factory-set switching frequency.

## Installing the graphic display terminal

## Installing the graphic display terminal on the drive

Drives with catalog numbers ending in the letter $Z$ are supplied without a graphic display terminal (VW3 A1 101). This can be ordered separately. It is installed on the drive as shown below.

The graphic display terminal can be connected or disconnected with the power on. Before disconnecting it, drive control via the display terminal must be disabled (refer to the Programming Manual).

## Position of the charging LED

Before working on the drive, turn it off, wait until the red capacitor charging LED has gone out, then measure the DC bus voltage.

## Position of the capacitor charging LED

```
ATV71H 037M3 to D15M3X, ATV71H D18M3 to D45M3X, ATV71H 075N4 to D18N4, ATV71H D22N4 to D75N4, and ATV71H U22Y to D90Y
```

## Procedure for measuring the DC bus voltage

## DANGER

## RISK OF ELECTRIC SHOCK

Read and understand the instructions on page $\underline{5}$ before performing this procedure.
Failure to follow this instruction will result in death or serious injury.

The DC bus voltage can exceed $1,000 \mathrm{~V}=$... Use a properly rated voltage sensing device when performing this procedure. To measure the DC bus voltage:

1 Disconnect the drive power supply.
2 Wait 15 minutes to allow the DC bus capacitors to discharge.
3 Measure the voltage of the $D C$ bus between the $\mathrm{PA} /+$ and $\mathrm{PC} /$ - terminals to check whether the voltage is less than 45 V --.. See page_ 26 for the arrangement of the power terminals.
4 If the DC bus capacitors have not discharged completely, contact your local Schneider Electric representative (do not repair or operate the drive).

## Installing option cards

These should ideally be installed once the drive is mounted and before wiring it.
Check that the red capacitor charging LED has gone out. Measure the DC bus voltage in accordance with the procedure indicated on page 19 .
The option cards are installed under the drive control front panel. If the drive has a graphic display terminal, remove it, then remove the control front panel as shown below.

## Removing the control front panel

- Using a screwdriver, press down on the catch and pull to release the lefthand part of the control front panel

- Do the same on the right-hand side

- Pivot the control front panel and remove it

## Installing an encoder interface card

There is a special slot on the drive for adding an encoder interface card.
 programmable card has already been installed, remove it so you can access the slot for the encoder interface card.

## Installing an I/O extension card, a communication card or a "Controller Inside" programmable card

## CAUTION

## RISK OF DAMAGE TO THE CONNECTOR

Ensure good positioning of the option card on the clasps to avoid damage to the connector.
Failure to follow these instructions can result in equipment damage.

(7) Replace the control front panel over the option card (same procedure as for installing the option card, see (5) and (6))

## Installing the EMC plates

ATV71H 037M3 to D15M3X, ATV71H 075N4 to D18N4, and ATV71H U15S6X to U75S6X

Installing the EMC clamps

ATV71H D18M3X to D45M3X, ATV71H D22N4 to D75N4, ATV71H U22Y to D90Y

1 - EMC plate for connecting the power cables
2 - EMC plate for connecting the control cables (for ATV71H 037M3 to D15M3X, ATV71H 075N4 to D18N4 and ATV71H U15S6X to U75S6X only)
3 - EMC plate for connecting the I/O option card cables (supplied with the option cards)
4 - M4 screws (supplied)
5 - M8 screws (supplied)
6 - EMC clamps with captive screws (supplied)

| ATV71H | $\Delta \mathrm{b}$ |  |
| :--- | :---: | :---: |
|  | mm | in. |
| 037M3 to U40M3, <br> 075N4 to U40N4 | 55 | 2.17 |
| U55M3 to D15M3X, <br> U55N4 to D18N4, | 65 | 2.56 |
| U15S6X to U75S6X |  |  |
| D18M3X to D45M3X, <br> D22N4 to D75N4, <br> U22Y to D90Y | 120 | 4.72 |

## Wiring recommendations

## Power section

The drive must be connected to the protective ground. To comply with current regulations concerning high leakage currents (above 3.5 mA ), use at least a $10 \mathrm{~mm}^{2}$ (AWG 6) protective conductor or 2 protective conductors with the same cross-section as the power section AC supply conductors.

## DANGER

## RISK OF ELECTRIC SHOCK

Connect the device to the protective ground using the grounding point provided, as shown in the figure below. The drive panel must be connected to the protective ground before power is applied.
Failure to follow this instruction will result in death or serious injury.

- Check whether the resistance to the protective ground is one ohm or less. Connect a number of drives to the protective ground, as shown in the diagram (see left). Do not lay protective grounding cables in a loop or in series.

## WARNING

## IMPROPER WIRING PRACTICES

- The ATV71 drive will be damaged if input line voltage is applied to the output terminals (U/T1,V/T2,W/T3).
- Check the power connections before powering up the ATV71 drive.
- If replacing another drive, verify that all wiring connections to the ATV71 drive comply with all wiring instructions in this manual.

Failure to follow these instructions can result in death, serious injury or equipment damage.

When upstream protection by means of a "residual current device" is required by the installation standards, a type A device should be used for single-phase drives and type B for three-phase drives. Choose a suitable model integrating:

- HF current filtering
- A time delay to prevent tripping caused by the load from stray capacitance on power-up. The time delay is not possible for 30 mA devices. In this case, choose devices with immunity against nuisance tripping, for example "residual current devices" with reinforced immunity from the s.i range (Merlin Gerin brand).

If the installation includes several drives, provide one residual current device per drive.

|  |
| :--- |
| INADEQUATE OVERCURRENT PROTECTION |
| - Overcurrent protective devices must be properly coordinated. |
| - The Canadian Electricity Code and the National Electrical Code require branch circuit protection. Use the fuses |
| recommended on the drive nameplate to achieve published short-circuit current ratings. |
| - Do not connect the drive to a power feeder whose short-circuit capacity exceeds the drive short-circuit current |
| rating listed on the drive nameplate. |
| Failure to follow these instructions can result in death, serious injury or equipment damage. |

## Wiring recommendations

Keep the power cables separate from circuits in the installation with low-level signals (sensors, PLCs, measuring apparatus, video, telephone).
The motor cables must be at least $0.5 \mathrm{~m}(20 \mathrm{in}$.) long.
In certain situations where the motor cables have to be submerged in water, earth leakage currents can cause tripping, requiring the addition of output filters.

Do not use surge arresters or power factor correction capacitors on the variable speed drive output.

## CAUTION

IMPROPER USE OF A BRAKING RESISTOR

- Only use the braking resistors recommended in our catalogs.
- Wire the thermal protection contact on the resistor so that the drive power supply is disconnected immediately in the event of a fault (refer to the manual supplied with the resistor).

Failure to follow these instructions can result in injury and/or equipment damage.

## Control section

Keep the control circuits away from the power circuits. For control and speed reference circuits, we recommend using shielded twisted cables with a pitch of between 25 and 50 mm ( 0.98 and 1.97 in .) and connecting the shielding to ground at each end.

If using conduit, do not lay the motor, power supply and control cables in the same conduit. Keep the metal conduit containing the power supply cables at least 8 cm ( 3 in .) away from the metal conduit containing the control cables. Keep the non-metal conduits or cable ducts containing the power supply cables at least 31 cm (12 in.) away from the metal conduits containing the control cables. If it is necessary for control and power supply cables to cross each other, be sure they cross at right angles.

## Length of motor cables

| ATV71H |  | 0 m <br> $(0 \mathrm{ft})$ | 10 m <br> $(32.8 \mathrm{ft})$ | 50 m <br> $(164 \mathrm{ft})$ | 100 m <br> $(328 \mathrm{ft})$ | 150 m <br> $(492 \mathrm{ft})$ | 300 m <br> $(984 \mathrm{ft})$ |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  | Shielded <br> cable |  |  |  |  |  |  |  |
| $(3280 \mathrm{ft})$ |  |  |  |  |  |  |  |  |

[^1]
## Power terminals

## Access to the power terminals

ATV71H 037M3 to D15M3X, ATV71H 075N4 to D18N4 and ATV71H U15S6X to U75S6X
Unlock the power part access flap and remove it as shown below.

Example of ATV71HU22M3

ATV71H D18M3X to D45M3X, ATV71H D22N4 to D75N4 and ATV71H U22Y to D90Y
To access the power terminals, remove the front panel as shown below.

Characteristics and functions of the power terminals

| Terminal | Function |
| :--- | :--- |
| $\frac{\perp}{\bar{I}}$ | Protective ground connection terminal |
| R/L1 | Power section AC supply |
| S/L2 |  |
| PO | DC bus + polarity |
| PA/+ | Output to braking resistor (+ polarity) |
| PB | Output to braking resistor |
| PC/- | DC bus - polarity |
| U/T1 <br> V/T2 <br> W/T3 | Outputs to the motor |

Only remove the link between PO and PA/+ if a DC choke has been added. The screws on the PO and PA/+ terminals must always be fully tightened as there is a high current flowing in the commoning link.

## Arrangement of the power terminals

## Control terminals

## Access to the control terminals

To access the control terminals, open the cover on the control front panel.

## Removing the terminal card

To make it easier to wire the drive control section, the control terminal card can be removed.

- Undo the screw until the spring is fully extended
- Remove the card by sliding it downwards

| CAUTION |
| :--- |
| IMPROPERLY SECURED TERMINAL CARD |
| When replacing the control terminal card, it is essential |
| to fully tighten the captive screw. |
| Failure to follow this instruction can result in injury |
| and/or equipment damage. |

## Arrangement of the control terminals

Maximum wire size: $2.5 \mathrm{~mm}^{2}$ - AWG 14

Max. tightening torque: $0.6 \mathrm{Nm}-5.3 \mathrm{lb}$.in

Note: The ATV71 is supplied with a link between the PWR and +24 terminals.

## Characteristics and functions of the control terminals

| Terminal | Function | Electrical characteristics |

This encoder card has two groups of parameter switches:

- The first is for selecting the supply voltage supplied by the interface card to the encoder: 5 V or 15 V .
- The second is a set of five switches numbered 1 to 5 (see diagram below). The division ratio for the ESIM outputs is selected using switches 1,2 and 3 . Switches 4 and 5 are used to select the input signals for the encoder card. Fault detection will be inhibited for the inputs selected using these switches.

| 1 | 2 | 3 | ESIM outputs | 4 | 5 | Encoder inputs |

## Selecting the encoder

The encoder interface cards available as options with the ATV71 enable the use of different encoder technologies (incremental ou absolute).

- Incremental encoder with differential outputs compatible with the RS422 standard
- Incremental encoder with open collector outputs
- Incremental encoder with push-pull outputs
- Incremental encoder with RS422-compatible differential outputs with encoder emulation
- Resolver absolute encoder
- SinCos incremental, SinCosHiperface absolute, EnDat absolute, SSI absolute encoders

The VW3 A3 408, VW3 A3 409 encoder cards available as an option with the ATV71 specification 383 can be used with a synchronous or asynchronous motor for closed-loop control.

## Option terminals

## Wiring the encoder

Use a shielded cable containing 3 twisted pairs with a pitch of between 25 and 50 mm ( 0.98 in . and 1.97 in .). Connect the shielding to ground at both ends.
The minimum cross-section of the conductors must comply with the data in the tables below, in order to limit line voltage drop:

| Max. encoder <br> cable length | VW3 A3 401...402 <br> current of encoder |  |  | Minimum cross-section <br> of conductors |
| :---: | :---: | :---: | :---: | :---: |

## Connection diagrams

## Connection diagrams conforming to standards EN 954-1 category 1, ISO 13849-1 and IEC/EN 61508 capacity SIL1, stopping category 0 in accordance with standard IEC/EN 602041

Single-phase power supply (ATV71H 075M3 to U75M3)
Diagram with line contactor

Diagram with switch disconnect

(1) Line choke, if used (compulsory for ATV71H U40M3 to U75M3 drives)
(2) Fault relay contacts for remote signaling of drive status

Inhibit the input phase loss fault (IPL) so that ATV71H 075M3 to U75M3 drives can operate on a single-phase supply (see Programming Manual). If this fault is set to its factory configuration, the drive will stay locked in fault mode.

Note: Install interference suppressors on all inductive circuits near the drive or connected to the same circuit (relays, contactors, solenoid valves, etc).

Choice of associated components:
Please refer to the catalog.

## Connection diagrams

Connection diagrams conforming to standards EN 954-1 category 1, ISO 13849-1 and IEC/EN 61508 capacity SIL1, stopping category 0 in accordance with standard IEC/EN 60204-1

Three-phase power supply
Diagram with line contactor

Diagram with switch disconnect

(1) Line choke (if used)
(2) Fault relay contacts for remote signaling of drive status

Note: Install interference suppressors on all inductive circuits near the drive or coupled to the same circuit (relays, contactors, solenoid valves, etc).

Choice of associated components:
Please refer to the catalog.

## Connection diagrams conforming to standards EN 954-1 category 3, ISO 13849-1 and IEC/EN 61508 capacity SIL2, stopping category 0 in accordance with standard IEC/EN 60204-1

This connection diagram is suitable for use with machines with a short freewheel stop time (machines with low inertia or high resistive torque). When the stop request is activated, the motor power supply is cut immediately and it stops in accordance with category 0 of standard IEC/EN 60204-1.

This diagram must be used for hoisting applications if a mechanical brake is controlled by the ATV71.
A contact on the Preventa XPS AC module must be inserted in the brake control circuit to engage it safely when the Power Removal safety function is activated.

(1) Line choke (if used)
(2) It is essential to ground the shielding on the cable connected to the Power Removal input.
(3) Use cable ends DZ5CE020 (yellow) on wires connected to PWR and +24 inputs.

- Standard EN 954-1 category 3 and ISO 13849-1 require the use of a dual-contact stop button (S1).
- S1 is used to activate the Power Removal safety function.
- S2 is used to initialize the Preventa module when powering up or after an emergency stop. ESC enables the use of other initialization conditions for the module.
- One Preventa module can be used for the Power Removal safety function on several ATV71 drives.
- A logic output on the Preventa module can be used to indicate reliably that the drive is operating in safe conditions.

## Note:

For preventive maintenance, the Power Removal function must be activated at least once a year.
The drive power supply must be turned off and then on again before carrying out this preventive maintenance.
The drive logic output signals cannot be considered as safety-type signals.
Install interference suppressors on all inductive circuits near the drive or coupled to the same circuit (relays, contactors, solenoid valves, etc).

## Choice of associated components:

Please refer to the catalog.

## Connection diagram conforming to standards EN 954-1 category 3, ISO 13849-1 and IEC/EN 61508 capacity SIL2, stopping category 1 in accordance with standard IEC/EN 60204-1

This connection diagram is suitable for use with machines with a long freewheel stop time (machines with high inertia or low resistive torque).

## な <br> This diagram must not be used for hoisting applications.

When the stop request is activated, deceleration of the motor, controlled by the drive, is requested first. Then, after a time delay corresponding to the deceleration time, the Power Removal safety function is activated.

## Example:

- 2-wire control
- LI1 assigned to forward
- LI2 assigned to reverse

(1) In this example, the logic inputs Lle are wired as "Source" but can be wired as "Sink Int" or "Sink Ext".
(2) Line choke (if used)
(3) It is essential to ground the shielding on the cable connected to the Power Removal input.
(4) Use cable ends DZ5CE020 (yellow) on wires connected to PWR and +24 inputs.
- Standard EN 954-1 category 3 and ISO 13849-1 require the use of a dual-contact stop button (S1).
- S1 is used to activate the Power Removal safety function.
- S2 is used to initialize the Preventa module when powering up or after an emergency stop. ESC enables the use of other initialization conditions for the module.
- One Preventa module can be used for the Power Removal safety function on several ATV71 drives. In this case the time delay must be set to the longest stopping time.
- A logic output on the Preventa module can be used to indicate reliably that the drive is operating in safe conditions.

## Note:

For preventive maintenance, the Power Removal function must be activated at least once a year.
The drive power supply must be turned off and then on again before carrying out this preventive maintenance.
The drive logic output signals cannot be considered as safety-type signals.
Install interference suppressors on all inductive circuits near the drive or coupled to the same circuit (relays, contactors, solenoid valves, etc).

## Logic input switch (SW1)

The logic input switch (SW1) is used to adapt the operation of the logic inputs to the technology of the programmable controller outputs.

- Set the switch to Source (factory setting) if using PLC outputs with PNP transistors.
- Set the switch to Sink Int or Sink Ext if using PLC outputs with NPN transistors.
- Switch SW1 set to "Source" position

- Switch SW1 set to "Source" position and use of an external power supply for the LIs

- Switch SW1 set to "Sink Ext" position

|  |
| :--- |
| UNINTENDED EQUIPMENT OPERATION |
| When switch SW1 is set to "Sink Int" or "Sink Ext", the common must never be connected to ground or the protective ground, |
| as there is then a risk of unintended equipment operation on the first insulation fault. |
| Failure to follow this instruction can result in death, serious injury or equipment damage. |

## Connection diagrams

## Bipolar speed reference

## Speed reference using axis control

## Switch SW2

The LI6 logic input switch (SW2) makes it possible to use the LI6 input:

- Either as a logic input by setting the switch to LI (factory setting)
- Or for motor protection via PTC probes by setting the switch to PTC

## Control power supply via an external source

The control card can be supplied via an external $+24 \mathrm{~V}=$-. supply source

- Switch in "Sink Ext" position

- Switch in "Sink Int" position

SW3 or SW4

## A WARNING

## UNINTENDED EQUIPMENT OPERATION

When switches SW3 or SW4 are set to "Sink Int" or "Sink Ext", the common must never be connected to ground or the protective ground, as there is then a risk of unintended equipment operation on the first insulation fault.
Failure to follow this instruction can result in death, serious injury or equipment damage.

## Connection diagrams

## Connection of several drives in parallel on the DC bus

Connection in parallel on the DC bus is recommended in applications for which full motor power must be guaranteed.
Each drive uses its own charging circuit

Drives (1), (2) and (3) must not be more than one size apart when they are connected in this way.
F1, F2, F3: Fast-acting semiconductor fuses for protection on the DC bus side.

## Use on IT system and corner grounded system

IT system: Isolated or impedance grounded neutral
Use a permanent insulation monitor compatible with non-linear loads, such as a Merlin Gerin type XM200 or equivalent.
Corner grounded system: System with one phase connected to ground
Altivar 71 drives feature built-in RFI filters. When using ATV71H U22Y to D90Y drives on an IT system, the link between these filters and ground must be removed as shown in the following diagrams. For other catalog numbers, removal of this link is possible but not mandatory:

Remove the jumper located to the left of the power terminals (two jumpers for ATV71•D22N4).

## A CAUTION

RISK OF DAMAGE TO THE DRIVE
On ATV71•075N4 to U40N4 ratings, if the filters are disconnected, the drive's switching frequency must not exceed 4 kHz . Refer to the Programming Manual for the corresponding parameter setting.
Failure to follow this instruction can result in injury and/or equipment damage.

## Use on IT system and corner grounded system

## Disconnection of the filter on ATV71H D37Y to D90Y products

## A WARNING

## RISK OF ELECTRIC SHOCK

- ATV71H U22Y to D90Y drives must not be connected to a corner grounded system.
- ATV71HeeeS6X must not be used with corner grounded systems in case of altitude is higher than 2000 m .

Failure to follow this instruction can result in death, serious injury or equipment damage.

## Electromagnetic compatibility

## Principle

- Grounds between drive, motor and cable shielding must have "high-frequency" equipotentiality.
- Use of shielded cables with shielding connected to ground at both ends for the motor cables, braking resistor (if used) and control-signal wiring. Metal ducting or conduit can be used for part of the shielding length provided that there is no break in continuity.
- Ensure maximum separation between the power supply cable (line supply) and the motor cable.

## Installation diagram

## ATV71H 037M3 to D15M3X, ATV71H 075N4 to D18N4 and ATV 71H U15S6X to U75S6X

- Attach and ground the shielding of cables 4 and 5 as close as possible to the drive:
- Strip the shielding.
- Use stainless steel metal clamps on the parts from which the shielding has been stripped, to attach them to the metal plate 2.

The shielding must be clamped tightly enough to the metal plate to ensure correct contact.

- Install the control EMC plate 11 on the sheet steel grounded plate 2, as shown in the diagram.
- Attach and ground the shielding of cables 7, 12 and 13 as close as possible to the drive:
- Strip the shielding.
- Use stainless steel metal clamps on the parts from which the shielding has been stripped, to attach them to the control EMC flange 9 .

The shielding must be clamped tightly enough to the metal plate to ensure correct contact.

1 Altivar 71
2 Sheet steel grounded plate supplied with the drive
3 Tapped holes for installing the control EMC plate
4 Shielded cable for motor connection, with shielding connected to ground at both ends. The shielding must be continuous and intermediate terminals must be in EMC shielded metal boxes.

5 Shielded cable for connecting the braking resistor (if used). The shielding must be continuous and intermediate terminals must be in EMC shielded metal boxes.

6 Non-shielded wires for relay contact output
7 Shielded cables for connecting the Power Removal safety function input. The shielding must be continuous and intermediate terminals must be in EMC shielded metal boxes.

8 Metal clamps
9 Protective ground connection
10 Unshielded power supply cable or wires
11 Control EMC plate
12 Shielded cables for connecting the control-signal section. For applications requiring several conductors, use cables with a small cross-section ( $0.5 \mathrm{~mm}^{2}$ - AWG 20).

13 Shielded cables for connecting the encoder. The shielding must be continuous and intermediate terminals must be in EMC shielded metal boxes.

## Note:

- If using an additional input filter, it should be installed under the drive and connected directly to the line supply via an unshielded cable. Link 10 on the drive is then established via the filter output cable.
- The HF equipotential ground connection between the drive, motor and cable shielding does not remove the need to connect the PE protective conductors (green-yellow) to the appropriate terminals on each unit.

## Installation diagram

## ATV71H D18M3X to D45M3X, ATV71H D22N4 to D75N4 and ATV71H U22Y to D90Y

Attach and ground the shielding of cables $\mathbf{4}$ and $\mathbf{5}$ as close as possible to the drive:

- Strip the shielding.
- Use stainless steel metal clamps on the parts from which the shielding has been stripped, to attach them to the metal plate $\mathbf{2}$.

The shielding must be clamped tightly enough to the metal plate to ensure correct contact.

- Attach and ground the shielding of cables 6, 7 and 8 as close as possible to the drive:
- Strip the shielding.
- Use stainless steel metal clamps on the parts from which the shielding has been stripped, to attach them to the drive.

The shielding must be clamped tightly enough to the metal plate to ensure correct contact.

1 Altivar 71
2 Sheet steel grounded plate supplied with the drive
3 Metal clamps
4 Shielded cable for motor connection, with shielding connected to ground at both ends. The shielding must be continuous and intermediate terminals must be in EMC shielded metal boxes.

5 Shielded cable for connecting the braking resistor (if used). The shielding must be continuous and intermediate terminals must be in EMC shielded metal boxes.

6 Shielded cables for connecting the control-signal section. For applications requiring several conductors, use cables with a small cross-section ( $0.5 \mathrm{~mm}^{2}$ - AWG 20).

7 Shielded cables for connecting the Power Removal safety function input. The shielding must be continuous and intermediate terminals must be in EMC shielded metal boxes.

8 Shielded cables for connecting the encoder. The shielding must be continuous and intermediate terminals must be in EMC shielded metal boxes.

9 Non-shielded wires for relay contact output
10 Protective ground connection
11 Unshielded power supply cable or wires

## Note:

- If using an additional input filter, it should be installed under the drive and connected directly to the line supply via an unshielded cable. Link 4 on the drive is then established via the filter output cable.
- The HF equipotential ground connection between the drive, motor and cable shielding does not remove the need to connect the PE protective conductors (green-yellow) to the appropriate terminals on each unit.

Electromagnetic compatibility, wiring

Installing the encoder cable for the VW3 A3 408, VW3 A3 409 and VW3 A3 411 cards (1 cable)

1 Strip the cable shielding.
2 Select the appropriate clamp for the cable diameter and attach it to the cable.
3 Attach the clamp to the bracket using one of the screws supplied with the card.
4 Use the ground screw to attach the bracket to the grounding point located next to the encoder card.

## Note:

The cable must be mounted on the EMC plate as shown in the diagram on page 46 for ATV71H 037M3 to D15M3X, ATV71H 075N4 to D18N4 and ATV71H U15S6X to U75S6X drives (position 13 on the diagram) and as shown in the diagram on page 47 for ATV71H D18M3X to D45M3X, ATV71H D22N4 to D75N4 and ATV71H U22Y to D90Y drives. It is not necessary to strip the cable for mounting on the EMC plate.

## Installing the encoder and ESIM cables for the VW3 A3 411 card (2 cables)

Repeat steps 1 to 4 above.
5 Strip the shielding from the ESIM cable.
6 Attach the clamp to the cable.
7 Attach the clamp to the bracket using the second screw supplied with the card.

[^0]:    (1)Add 7 W to this value for each option card added

[^1]:    With dv/dt filters
